

100% recycled PCR

Compound made of Biopolymer with added recycled raw material

PCR with low footprint

Take a look at G4, a 100% post-consumer recycled (PCR) material with an extremely low CO₂ footprint

As part of our ambition to develop materials with sustainability and circularity in mind, we are proud to present a brand new material that represents the next generation of compounds at Axjo, aligned with our Greenology concept.

This material is created from used beverage cartons that we compound within our Greenology concept with other recycled materials to give it unique characteristics tailored for cold climates and increased mechanical strain.
